More general formulation of Problem 2.1.2

Let k and n be fixed non-negative integers. How many solutions are there to the equation

$$t_1 + t_2 + t_3 + \dots + t_k = n$$
 where $t_1 \in A_1, t_2 \in A_2, \dots, t_k \in A_k$

In Problem 2.1.2, we had $A_1=A_2=\cdots=A_k=Z_{\geq 0}$

In general, we let $S = A_1 \times A_2 \times \cdots \times A_k$

Let
$$\omega((t_1, t_2, ..., t_k)) = t_1 + t_2 + \cdots + t_k$$

General solution

We compute

$$\Phi_{A_1}(x), \Phi_{A_2}(x), \dots, \Phi_{A_k}(x)$$

By the Product Lemma, we obtain

$$\Phi_S(x) = \Phi_{A_1}(x)\Phi_{A_2}(x)\cdots\Phi_{A_k}(x)$$

So for any integer n, the number of solutions to $t_1 + t_2 + t_3 + \cdots + t_k = n$ with $t_j \in A_j$ is

$$[\mathbf{x}^{\mathsf{n}}]\Phi_{\mathsf{S}}(\mathbf{x})$$

Problem 2.1.3

How many compositions of n are there with k parts, where each part is odd, for $n \ge k \ge 1$?

We can mathematically reformulate this problem as follows:

Let
$$S=Z_{odd}\times Z_{odd}\times \cdots \times Z_{odd}=\left(Z_{odd}\right)^k$$
 . Let $\omega((t_1,t_2,\ldots,t_k))=t_1+t_2+\cdots+t_k$.

Problem 2.1.3 solution

$$Z_{odd} = \{1, 3, 5, 7, \cdots\}$$

We compute

$$\Phi_{Z_{odd}}(x) = x + x^3 + x^5 + \dots = \frac{x}{1 - x^2}$$

By the Product Lemma, we obtain

$$\Phi_{S}(x) = (\Phi_{Z_{odd}}(x))^{k} = x^{k}(1-x^{2})^{-k}$$

So for any integer n, the number of compositions of n into k parts ($n \ge k \ge 1$) is:

$$\left[x^{n}\right]\Phi_{S}(x) = \left[x^{n}\right]x^{k}\left(1-x^{2}\right)^{-k}$$

Problem 2.1.3 solution

So for any integer n, the number of compositions of n into k odd parts $(n \ge k \ge 1)$ is:

$$\begin{bmatrix} x^n \end{bmatrix} \Phi_S(x) = \begin{bmatrix} x^n \end{bmatrix} x^k (1 - x^2)^{-k}$$

$$= \begin{bmatrix} x^{n-k} \end{bmatrix} (1 - x^2)^{-k}$$

$$= \begin{bmatrix} x^{n-k} \end{bmatrix} \sum_{i=0}^{\infty} {k+i-1 \choose i} x^{2i}$$

Problem 2.1.3 solution

$$= \left[x^{n-k}\right] \sum_{i=0}^{\infty} \binom{k+i-1}{i} x^{2i}$$

$$(need 2i = n-k)$$

$$= \begin{cases} 0 & \text{if n-k is odd} \\ \binom{k+\frac{n-k}{2}-1}{2} & \text{if n-k is even} \\ \frac{n-k}{2} & \frac{n-k}{2} \end{cases}$$

Problem 2.1.4

How many compositions of n are there with k parts, where each part at most 5, for $n \ge k \ge 1$?

We can mathematically reformulate this problem as follows:

Let
$$S = N_5 \times N_5 \times \cdots \times N_5 = N_5^k$$
 $N_5 = \{1, 2, 3, 4, 5\}$

Let
$$\omega((t_1, t_2, ..., t_k)) = t_1 + t_2 + \cdots + t_k$$
.

Problem 2.1.5 solution

We compute

$$\Phi_{N_5}(x) = x + x^2 + x^3 + x^4 + x^5$$

$$= x(1 + x + x^2 + x^3 + x^4) = \frac{x(1 - x^5)}{1 - x}$$

By the Product Lemma, we obtain

$$\Phi_{S}(x) = (\Phi_{N_{5}}(x))^{k} = x^{k} (1 - x^{5})^{k} (1 - x)^{-k}$$

Problem 2.1.5 solution

So for any integer n, the number of compositions of n into k parts of size at most 5 $(n \ge k \ge 1)$ is:

$$\left[x^{n} \right] \Phi_{S}(x) = [x^{n-k}] (1 - x^{5})^{k} (1 - x)^{-k} \\
 = [x^{n-k}] \left(\sum_{i=0}^{\infty} {k \choose i} (-x^{5})^{i} \right) \left(\sum_{j=0}^{\infty} {k+j-1 \choose j} x^{j} \right) \\
 = [x^{n-k}] \left(\sum_{i=0}^{\infty} \sum_{j=0}^{\infty} (-1)^{i} {k+j-1 \choose j} {k \choose i} x^{5i+j} \right)$$

Problem 2.1.5 solution

So for any integer n, the number of compositions of n into k parts of size at most 5 $(n \ge k \ge 1)$ is:

$$\begin{bmatrix} x^n & \Phi_S(x) = \cdots & = \\ \frac{n-k}{5} & (-1)^i & n-5i-1 \\ i & n-k-5i \end{bmatrix}$$

Problem 2.1.5

We can also count numbers of compositions without specifying the number of parts.

Let n be a non-negative integer. How many compositions of n are there?

We can mathematically reformulate this problem as follows:

Let
$$S = \{()\}\bigcup Z_{\geq 1}\bigcup Z_{\geq 1}\times Z_{\geq 1}\bigcup\cdots\bigcup (Z_{\geq 1})^k\bigcup\cdot$$
 (empty composition)
$$=\bigcup^{\infty}(Z_{\geq 1})^k$$

The Sum Lemma

THM1.6.1: Let (A,B) be a partition of a set S (i.e. $S = A[\dot{B}]$, the disjoint union of A and B).

Then

$$\Phi_S(x) = \Phi_A(x) + \Phi_B(x)$$

Generalized Sum Lemma

Let the set S be a disjoint union of the sets

$$A_0, A_1, A_2, A_3, \cdots$$

i.e.
$$S = \bigcup_{k=0}^{\infty} A_k$$

$$\Phi_S(x) = \sum_{k=0}^{\infty} \Phi_{A_k}(x)$$

Special Case

Let the set S be a disjoint union of the sets

$$A_0, A_1, A_2, A_3, \cdots$$

where
$$A_0 = \{()\} = A^0, A_1 = A, A_2 = A \times A, A_k = A^k$$

i.e.
$$S = \bigcup_{k=0}^{\infty} A^k$$

(product lemma)

$$\Phi_S(x) = \sum_{k=0}^{\infty} \Phi_{A^k}(x) = \sum_{k=0}^{\infty} \left(\Phi_A(x)\right)^k$$

$$= \frac{1}{1 - \Phi_A(x)}$$

Problem 2.1.8

Let
$$\omega(())=0$$

$$\omega((t_1,t_2,\ldots,t_k))=t_1+t_2+\cdots+t_k, \quad \forall k\geq 1$$

$$\left[x^{n}\right]\Phi_{S}(x)$$

Problem 2.1.8 solution

We compute

$$\Phi_{Z_{\geq 1}}(x) = x + x^2 + x^3 + \dots = \frac{x}{1 - x}$$

and (by the product lemma)

$$\Phi_{(Z_{\geq 1})^k}(x) = \left(\Phi_{Z_{\geq 1}}(x)\right)^k = x^k (1-x)^{-k}$$
So
$$\Phi_S(x) = \sum_{k=0}^{\infty} \Phi_{(Z_{\geq 1})^k}(x) = \sum_{k=0}^{\infty} \left(x(1-x)^{-1}\right)^k$$

$$= \frac{1}{1-x(1-x)^{-1}}$$

Problem 2.1.8 solution

So
$$\Phi_{S}(x) = \frac{1}{(1-x(1-x)^{-1})} \frac{(1-x)}{(1-x)}$$

$$= \frac{1-x}{1-2x}$$

$$= (1-x)(1+2x+4x^{2}+\cdots+2^{j}x^{j}+2^{j+1}x^{j+1}+\cdots)$$

$$= 1+2x+4x^{2}+\cdots+2^{j}x^{j}+2^{j+1}x^{j+1}+\cdots$$

$$-x-2x^{2}-\cdots-2^{j-1}x^{j}-2^{j}x^{j+1}-\cdots$$

Problem 2.1.8 solution

$$\Phi_{S}(x) = 1 + 2x + 4x^{2} + \dots + 2^{j} x^{j} + 2^{j+1} x^{j+1} + \dots$$
$$-x - 2x^{2} - \dots - 2^{j-1} x^{j} - 2^{j} x^{j+1} - \dots$$

$$=1+x+2x^2+\cdots+2^{j-1}x^j+2^jx^{j+1}+\cdots$$

So the number of elements in S with weight n is:

$$\left[x^n \right] \Phi_S(x) = \begin{cases} 1 & \text{if n=0} \\ 2^{n-1} & \text{if n} \ge 1 \end{cases}$$

Another example

Let n be a non-negative integer. How many compositions of n are there in which all parts are at least 3?

We can mathematically reformulate this problem as follows:

Let
$$S=\{()\}\bigcup Z_{\geq 3}\bigcup Z_{\geq 3}\times Z_{\geq 3}\bigcup\cdots\bigcup (Z_{\geq 3})^k\bigcup\cdot$$
 (empty composition)
$$=\bigcup_{k=0}^\infty (Z_{\geq 3})^k$$

Let
$$\omega(())=0$$

$$\omega((t_1,t_2,\ldots,t_k))=t_1+t_2+\cdots+t_k, \quad \forall k\geq 1$$

$$\left[x^n\right]\Phi_S(x)$$

We can compute

$$\Phi_{Z_{\geq 3}}(x) = x^3 + x^4 + x^5 + \dots = \frac{x}{1 - x}$$

and (by the product lemma)

$$\Phi_{(Z_{>3})^k}(x) = (\Phi_{Z_{\geq 3}}(x))^k = (x^3(1-x)^{-1})^k$$

So
$$\Phi_S(x) = \sum_{k=0}^{\infty} \Phi_{(Z_{\geq 3})^k}(x) = \sum_{k=0}^{\infty} (x^3(1-x)^{-1})^k$$

$$= \frac{1}{1 - x^3 (1 - x)^{-1}}$$

So
$$\Phi_S(x) = \frac{1}{(1-x^3(1-x)^{-1})} \frac{(1-x)}{(1-x)}$$
$$= \frac{1-x}{1-x-x^3}$$

So the number of elements in S with weight n is:

$$\left[x^{n}\right] \frac{1-x}{1-x-x^{3}}$$
